1 15. The symbiotic computing system of claim 1, wherein actions are buffered by at 2 least one of the symbiotic partners.

1

1

2

16. The symbiotic computing system of claim 1, wherein actions affecting the managed resource are investigated to determine whether they are consistent.

1

1 17. The symbiotic computing system of claim 16, wherein upon determining that
2 actions are inconsistent, some of the inconsistent actions are rejected.

1

1 18. The symbiotic computing system of claim 16, wherein actions are ordered in an 2 attempt to determine whether they are inconsistent.

1

1

2

19. The symbiotic computing system of claim 16, wherein when it is determined that actions are inconsistent, multiple copies of the managed resource are created.

REMARKS

5

10

In the Office Action, the Drawings were objected to, the specification at page 16, lines 21-23 was objected to, and claims 1-19 were rejected under 35 U.S.C. 103(a) as being patentable over various combinations of Kontothanassis et al. (U.S. Patent No. 6,341,339), Slaughter (U.S. Patent No. 6,058,400), and Choquier et al. (U.S. Patent No. 5,774,668).

In response to the objection to the drawings, the drawings have been amended. Attached hereto are format drawings that overcome the objections of the Official Draftsperson. In response to the objection to the specification, the objected to portion of the specification has been

amended. In response to the obviousness rejections, independent claim 1 and various dependent claims have been amended.

In particular, amended claim 1 requires a symbiotic computing system. The symbiotic computing system includes a plurality of symbiotic partners communicatively coupled with one another, each of the plurality of symbiotic partners having a respective instance of a managed resource; (2) at least two symbiotic partners of the plurality of symbiotic partners receiving input from a local user affecting a respective instance of the managed resource; (3) the at least two symbiotic partners producing respective actions based upon the respective input and storing the respective input; (4) each of the at least two symbiotic partners awaiting availability of communication paths to each other of the plurality of symbiotic partners; (5) each of the at least two symbiotic partners transmitting respective actions to the each other of the symbiotic partners; and (6) the each other of the symbiotic partners receiving the respective actions from the each of the at least two symbiotic partners and using the respective actions to affect a respective instance of the managed resource to maintain coherency of the managed resource.

10

15

20

In contradistinction to the required elements of claim 1, the cited references singularly or in combination fail to teach or suggest a symbiotic computing system that includes a plurality of symbiotic partners communicatively coupled with one another, where each of the plurality of symbiotic partners having a respective instance of a managed resource, at least two symbiotic partners of the plurality of symbiotic partners receiving input from a local user affecting a respective instance of the managed resource, the at least two symbiotic partners producing respective actions based upon the respective input and storing the respective input, each of the at least two symbiotic partners awaiting availability of communication paths to each other of the plurality of symbiotic partners, each of the at least two symbiotic partners transmitting respective

actions to the each other of the symbiotic partners, and the each other of the symbiotic partners receiving the respective actions from the each of the at least two symbiotic partners and using the respective actions to affect a respective instance of the managed resource to maintain coherency of the managed resource.

Further, the claims that depend from claim 1 include additional limitations that the cited prior art fails to teach, disclose, or suggest. In particular, claim 2, that depends from claim 1 includes the additional limitations that the managed resource comprises a data entity, each of the symbiotic partners retains a respective instance of the data entity, and alterations made to an instance of the data entity are made to each other instance of the data entity to maintain coherency. The cited references fail to teach, disclose, or suggest the teachings of claim 2.

5

10

15

20

Amended claim 3, that depends from claim 2, requires that alterations made to any instance of the data entity are made to each other instance of the data entity to maintain coherency when communication paths from the each of the at least two symbiotic partners to each other of the plurality of symbiotic partners are available and the respective actions are transmitted. The cited references fail to teach, disclose, or suggest the teachings of claim 3.

Amended claim 4, that depends from claim 3, requires that the alterations made to any instance of the data entity are made to each other instance of the data entity to maintain coherency. The cited references fail to teach, disclose, or suggest the teachings of claim 4. Amended claim 5, that depends from claim 2, requires that the data entity is selected from the group consisting of data files, data bases, configuration files and source files. The cited references fail to teach, disclose, or suggest the teachings of either claim 4 or claim 5.

As is evident from the claims that are provided above, claims 6-19 include limitations that are also not disclosed, taught, or suggested by the cited prior art references. For the reasons

that amended independent claim 1 is allowable, and because of the additional limitation found in dependent claims 2-19, claims 1-19 are in a condition for allowance. Thus, a notice of allowance is courteously solicited. Please direct any questions or comments to the undersigned attorney.

OFFICE OF PETITIONS

VERSION WITH MARKINGS TO SHOW CHANGES MADE

In the Specification:

The paragraph beginning at page 16, line 17 has been amended as follows:

Another application of the symbiotic computing systems of FIGs. 1 and 2 is that of video teleconferencing. Because the transmission of real-time video requires significant communication bandwidth, methodologies may be employed to create virtual video-images that consume significantly less communication bandwidth so that a computer network may be employed as a communication link. One such technique is described in U.S. Patent Application Serial No. 09/306,313 [xxx,xxx], filed by Thomas W. Lynch on May 6, 1999, and hereby incorporated herein by reference in its entirety. In the disclosed technique, a virtual video image of a user is created from a video image library (video image database) at one or more remote sites based upon cues gathered from the user. In a teleconferencing application, each attendee of the teleconference should be presented with an identical virtual video image of the user. Thus, according to the present invention, the virtual video image is designated as a managed resource and the computer of each attendee creating and displaying the video image of the user is made a symbiotic partner so that the images presented are identical.

In the claims:

Claims 1, 3, 4, 5, 8, and 10 have been amended as indicated:

- 1. (Amended) A symbiotic computing system comprising:
- a plurality of symbiotic partners communicatively coupled with one another, each of the
- 3 plurality of symbiotic partners having a respective instance of a managed resource;

at least two symbiotic partners of the plurality of symbiotic partners receiving input from 4 a local user affecting a respective instance of the managed resource; 5 the at least two symbiotic partners producing respective actions based upon the respective 6 7 input and storing the respective input; each of the at least two symbiotic partners awaiting availability of communication paths 8. ' 9 to each other of the plurality of symbiotic partners; each of the at least two symbiotic partners transmitting [the] respective actions to the 10 each other of the symbiotic partners; and 11 the each other of the symbiotic partners receiving the respective actions from the each of 12 the at least two symbiotic partners and using the respective actions to affect a respective instance 13 of the managed resource to maintain coherency of the managed resource. 14 1 (Amended) The symbiotic computing system of claim [1] 2, wherein alterations 3. 1 made to any instance of the data entity are made to each other instance of the data entity to 2 maintain coherency when communication paths from the each of the at least two symbiotic 3 partners to each other of the plurality of symbiotic partners are available and the respective 4 actions are transmitted. 5 1 (Amended) The symbiotic computing system of claim [1] 3, wherein alterations 1 4. made to [a reference] any instance of the data entity are made to each other instance of the data 2 entity to maintain coherency. 3 1

- 5. (Amended) The symbiotic computing system of claim [1] 2, wherein the data entity is selected from the group consisting of data files, data bases, configuration files and source files.
- 8. (Amended) The symbiotic computing system of claim 1, wherein the symbiotic [computer] computing system resides within a client/server environment.

1

.1

1

1 10. (Amended) The symbiotic computing system of claim 1, wherein the symbiotic
 2 [computer] computing system resides within an object oriented environment.
